RESEARCH REPORT

"Is Artificial Intelligence Killing Human Creativity?

A Quantitative Study of AI Dependency, Loss of Original Thinking, Human Touch in Content, and Creative Confidence Among College Students"

Specialization	General Management / Business Analytics
Research Type	Purely Quantitative Research
Data Collection Tool	Structured Survey Questionnaire (5-point Likert Scale)
Target Respondents	College / University Students (BBA, MBA, PGDM, Engineering, etc.)
Statistical Tools	Descriptive Statistics, Pearson Correlation, Multiple Regression, ANOVA
Submitted To	Dr. Narendra Singh Chaudhary
Submitted By	Amit Bhowmik, Aryan Giri | Group 9, PGDM 2025-27
Year	2025

Abstract

The quick introduction of Artificial Intelligence tools like ChatGPT, Google Gemini, Microsoft Copilot and Midjourney into school and work life has caused a problem. This problem is the loss of human creativity. Artificial Intelligence helps us get work done.. We do not know how it affects students ability to think creatively. We also do not know about the quality of their work. This is especially true in colleges. This study looks at how Artificial Intelligence use's affecting human creativity in college students. These students study Management, Engineering, Arts and Science. We looked at five things.
* How much students use Artificial Intelligence
* How often they use it
* If students rely much on Artificial Intelligence generated content
* If students do not try hard to think of new ideas
* If students creative work is missing a touch
We also looked at how much students know about Artificial Intelligence. We compared these to two things.
* If students confidence in their creativity is going down
* If the quality of their work is getting worse.
The type of subject students study also played a role in this study.
We collected information from college students using a questionnaire. The answers ranged from strongly disagree to agree. We tested seven ideas. We used methods like looking at the numbers and checking if the questionnaire was reliable. We also compared the results. What we found out is important for teachers, employers, people who make Artificial Intelligence tools and students .Artificial Intelligence is a part of this study. We also looked at Human Creativity. Other things we looked at include Artificial Intelligence Dependency, Creative Confidence, Original Thinking, Human Touch, Generative Artificial Intelligence, College Students and Quantitative Research in India. Artificial Intelligence and Human Creativity are important to this study. This study is about Artificial Intelligence and its impact on Human Creativity. We used methods, like Descriptive Statistics and Multiple Linear Regression. We used these methods to understand Artificial Intelligence and Human Creativity.

1. Introduction

Generative Artificial Intelligence tools have really changed the way college students think and work. This has all happened quickly and schools and rules have not been able to keep up. Since ChatGPT came out in November 2022 a lot of people have started using it. In two months the platform had 100 million users. This makes it the growing consumer application ever.

* By 2024 77% of college students worldwide say they use Artificial Intelligence for tasks.

* Over 40% use it for work like essays, presentations, design and coding.

In India students in management, engineering and liberal arts programs are also using Artificial Intelligence tools a lot. They use Artificial Intelligence for both academic work.

Being creative is a skill. It means coming up with ideas making new connections and expressing yourself in a unique way. The World Economic Forums Future of Jobs Report says that creativity originality and initiative will be the skills employers look for until 2027.

However some people are worried that Artificial Intelligence tools might be hurting creativity. Teachers say that student work often lacks ideas and imperfections that show human thinking. Designers say that Artificial Intelligence-generated visuals are technically good but lack nuance and emotional depth. Writers say they are relying much on Artificial Intelligence prompts and losing their own instincts for writing.

The main question of this research is: Is Artificial Intelligence helping creativity or is it replacing it?

* Giving tasks to tools is a known concept in cognitive psychology.

* However it is not clear if relying on Artificial Intelligence for tasks hurts students creative ability, confidence and quality of work.

Some research found that Artificial Intelligence can improve output in the short term. However it also reduces the diversity and originality of work overall. This has implications for creativity in society and professions.

For management education this question is very important. Organizations need creativity for innovation, branding, customer connection and problem-solving. Business schools and PGDM programs need to understand if Artificial Intelligence is helping or hurting the capacity of workers.

This study surveyed college students in four disciplines. It used statistics to create a model of Artificial Intelligences impact, on creativity in the Indian college context.

2. Review of Literature

2.1 Creativity as a Cognitive and Professional Competency

Creativity is something that people know is very important. A woman named Amabile came up with a theory about creativity in 1983. She said that creativity has three parts:

* skills that're good for a specific area

* ways to think that help people be creative

* wanting to do a task because you enjoy doing the task of creativity.

These three things make someone creative with creativity. This idea showed that creativity is not something you are born with it is creativity that you can learn and get better at over time. Creativity can be hurt by the things around you. This is important to think about when we're looking at how computers are affecting creativity.

The World Economic Forums Future of Jobs Report from 2023 says that creativity is a skill. Employers want people who can think creatively with creativity and come up with ideas using creativity. They want people who can solve problems in ways using creativity. That is what makes people different from machines with the help of creativity. If young professionals are not creative with creativity it is a problem for schools and companies. They need to teach people how to be creative with creativity and think for themselves using creativity. Creativity is very valuable. We must not lose creativity.

The World Economic Forums report shows that creativity will be a skill that employers will look for in the years. Creativity makes people special with the help of creativity. It will help them succeed in their jobs using creativity. People need creativity to do well, with creativity. Creativity is something that we should focus on it is creativity that we need to focus on.

2.2 Generative AI and Its Adoption Among College Students

The way students do their school work has changed a lot because of language models and generative AI platforms. After ChatGPT came out in November 2022 a lot of college students started using it. Some research by EduRank in 2024 found that than 77 percent of college students all over the world use AI tools to help them with school and a big part of that is for creative work like writing, design, coding and presentations.

In India students in business engineering and humanities programs are using language models and generative AI platforms much as students in other countries.. We do not have a lot of information about how students in India are using language models and generative AI platforms. Students say they use language models and generative AI platforms to get their school work done faster to think of ideas when they are stuck and to make their school work sound better. These are benefits of using language models and generative AI platforms. We do not know enough about what happens to students minds when they use language models and generative AI platforms all the time for school work that they would normally have to do on their own like being creative.

Students use language models and generative AI platforms for things like writing and design. This is what we call tasks. The use of language models and generative AI platforms, for these tasks is very common. Students use language models and generative AI platforms to help them with these tasks because it makes their school work easier and faster. Students use language models and generative AI platforms to generate ideas and to make their school work look more professional. This is what students mean by polishing their drafts and making their school work look better with the help of language models and generative AI platforms.

2.3 Cognitive Offloading and the Risk to Original Thinking

Risko and Gilbert in their 2016 study discuss offloading. This is when we use actions to make our brains work less hard.

* Cognitive offloading can be good because it frees up our brain to do things.
* But there is a risk: if we get used to offloading our brains can get weaker in those areas.

For example Oppenheimer and Mueller did a study in 2014 on taking notes. They found that students who typed notes did not think deeply like those who wrote by hand. This is because writing by hand makes you think more.

When we use Artificial Intelligence tools a lot it might make us lose the ability to think creatively on our own. This happens when we always let Artificial Intelligence tools do the work of brainstorming coming up with ideas and drafting for us.

The result is that we get less good at thinking by ourselves. This idea is linked to something called Reduced Effort in Original Thinking. It is a part of a study that looks at how using Artificial Intelligence tools can affect our confidence.

This is something that has not been studied before. So we want to see how using Artificial Intelligence tools affects our ability to think creatively. The study aims to understand this relationship, between Artificial Intelligence tools and our ability to think creatively.

2.4 AI-Generated Content and the Loss of Human Touch

Chamberlain and his team found out in 2023 that people always rate works made by Artificial Intelligence in terms of how much they feel connected to it how much it expresses the person who made it and how genuine it is compared to works created by people. This is something that happens even when people cannot tell if a work was made by Artificial Intelligence or a human by looking at it. This finding shows that there is a problem: works made by Artificial Intelligence are missing something that people bring to their work. Because of this people who create and look at works are aware that something is missing. This creates a gap in how much we trust the works that people create.

Zuboff said in 2019 that systems that use algorithms to watch people and understand them are changing who we are and how control we have over our own lives. This change is not, about money. When we talk about work there is a concern that students who use Artificial Intelligence

SPARSH GLOBAL BUSINESS SCHOOL

to help them create things may slowly lose their unique way of creating and their own style. This loss of what makes us human is a part of how Artificial Intelligence affects creativity. It is something that people have talked about but not really measured. Artificial Intelligence is changing the way we create. This is affecting the special things that people bring to their work like their own unique voice and style and the emotional connection that people feel when they look at a work made by a human.

2.5 AI Dependency and Creative Confidence

Doshi and Hauser did a study in 2023 that was published in Science Advances. They found out that when people use intelligence tools to be creative they can make more things but their ideas are not as different from each other. People who use these tools are more productive. They are not as original. They start to make things that're similar to what the artificial intelligence tool makes instead of coming up with completely new ideas. This study helps prove that relying on intelligence too much can make people less confident in their ability to be creative.

The reason why relying on intelligence can hurt our confidence in being creative is probably because of what we think we can do. When students can only do things with the help of artificial intelligence they might start to think they are not good enough to do it on their own. The more they use intelligence to be creative the less confident they become in their ability to do it without help. This is because they start to rely on the intelligence tool too much and they forget that they can be creative, on their own.

2.6 AI Awareness as a Potential Buffer

The thing people often forget when talking about intelligence and creativity is how important it is to understand intelligence. A man named Stern figured out a time ago that when people know what will happen if they do something it can change their behavior. It is of like that with artificial intelligence. If students know how artificial intelligence works, what it can and cannot do and what might happen if they rely on intelligence too much they might be able to use it in a better way.

* There are things people do not know about intelligence and creativity
* One of the things people do not know is how knowing about intelligence affects the way people use artificial intelligence

No one has done a study to see if knowing about artificial intelligence really makes a difference in how people use artificial intelligence and if it hurts their creativity. This is a gap in what we know. This study is going to try to fill it. Artificial intelligence awareness is what we are talking about. We want to know if it changes the way artificial intelligence use and creative erosion are related. We are going to look at intelligence awareness and see if it makes a difference, in artificial intelligence use.

SPARSH GLOBAL BUSINESS SCHOOL

3. Gap in Research

There is an increase in the use of AI tools among college students all over the world and in India.. When we look at what has been written about how AI affects human creativity we find some big holes in the information. The current study is meant to fill in these holes one by one. The table below shows the holes in the information that we found when we looked at what other people have written and what this study adds to the conversation, about AI and human creativity.

Gap Area	What Existing Literature Does	What This Study Adds
Research Design	Most existing studies on AI and creativity are qualitative, anecdotal, or case-study-based	This study is purely quantitative - using Likert scales, Pearson correlation, multiple regression, and ANOVA to statistically validate all findings
Focus of Study	Existing research focuses predominantly on academic integrity, plagiarism, and AI detection	This study focuses exclusively on creativity as a cognitive and professional outcome - confidence erosion and output quality decline
Multi-variable Model	Prior studies examine one or two dimensions of AI use in isolation (e.g., frequency alone or content reliance alone)	This study simultaneously examines five IVs (AI dependency, content over-reliance, reduced thinking, loss of human touch, AI awareness) and their combined effect on two DVs
Indian Context	Research is dominated by studies from the US, Europe, and East Asia; Indian college students are vastly under-represented	This study provides the first multi-variable quantitative baseline specifically from the Indian college setting
Discipline Comparison	Existing literature rarely compares AI's creative impact across different academic disciplines	One-way ANOVA is used to statistically compare Management, Engineering, Arts, and Science students' experiences
Moderating & Awareness Variables	AI awareness as a potential buffer against creative erosion has not been studied quantitatively	IV5 (AI Awareness) is included as a predictor, allowing the study to test whether more informed students suffer less creative erosion

In summary, The field is missing something. We do not have a model that looks at how Indian college students use Artificial Intelligence and how it affects their creativity. This model should be able to measure a lot of things like how students depend on Artificial Intelligence if they rely too much on content from others if they think originally if they are losing the human touch in their work and if they really understand Artificial Intelligence. It should also see how all these things together. Separately affect how confident students feel about being creative and the quality of their work. This study is going to fill that gap. It will look at students, from subjects to see what is happening. Artificial Intelligence is a part of this study because we want to know how it is affecting the creativity of Indian college students..

4. Research Objectives

This study is guided by four objectives that we can measure and test.

1. We want to find out how much college students in fields like Management, Engineering, Arts/Humanities and Science rely on artificial intelligence. We also want to know how often they use artificial intelligence generated content and if this is affecting their ability to think originally. We will use a survey to get this information from the students.

2. We want to see if there is a connection between students relying much on artificial intelligence using artificial intelligence generated content not thinking originally and losing the human touch in their work. We also want to know if these things are affecting their confidence in being creative. We will use a kind of analysis to see if these things are related.

3. We want to figure out which thing is most affecting the quality of students creative work and their confidence in being creative. Is it relying much on artificial intelligence using artificial intelligence generated content too much not trying hard enough to think of new ideas losing the human touch or not knowing enough about artificial intelligence? We will use a kind of analysis to compare these things and see which one is the most important.

4. We want to compare how artificial intelligence is affecting students from fields like Management, Engineering, Arts/Humanities and Science. We want to see if artificial intelligence is affecting their confidence in being creative and the quality of their work in the way or if it is different. We will use a kind of test to see if there are any big differences, between the groups of students.

SPARSH GLOBAL BUSINESS SCHOOL

5. Research Hypotheses

Since this is a purely quantitative study, every research question is framed as a testable null hypothesis (H0) and an alternate hypothesis (H1). The table below presents all seven hypotheses that guide the statistical analysis:

H#	Variables	Null Hypothesis (H0) - No Effect	Alternate Hypothesis (H1) - Effect Exists
H1	IV1 -> DV1	There is no significant relationship between AI dependency/usage frequency and erosion of creative confidence.	Higher AI dependency is significantly associated with greater erosion of creative confidence. (Expected: positive correlation, r > 0)
H2	IV2 -> DV1	Over-reliance on AI-generated content does not significantly	Students who over-rely on AI-generated content show signifi-

H#	Variables	Null Hypothesis (H0) - No Effect	Alternate Hypothesis (H1) - Effect Exists
		affect erosion of students' creative confidence.	cantly higher erosion of creative confidence. (Expected: positive correlation)
H3	IV3 -> DV2	Reduced effort in original thinking due to AI use does not significantly predict decline in creative output quality.	Greater reduction in original thinking effort significantly predicts decline in perceived creative output quality. (Expected: positive regression coefficient)
H4	IV4 -> DV2	The perceived loss of human touch in AI-assisted work does not significantly predict decline in creative output quality.	Higher perceived loss of human touch significantly predicts decline in creative output quality. (Expected: positive regression coefficient)
H5	IV5 -> DV1	AI awareness level has no significant relationship with erosion of creative confidence.	Higher AI awareness is significantly associated with lower erosion of creative confidence. (Expected: negative correlation)
H6	MV -> DV1, DV2	There is no significant difference in creative confidence erosion or output quality decline across Management, Engineering, Arts, and Science students.	There is a statistically significant difference in creative impact of AI across at least two academic disciplines (ANOVA, $p < 0.05$).
H7	IV1-IV5 -> DV1, DV2	The combined set of five IVs does not significantly predict creative confidence erosion or output quality decline.	The combined regression model of five IVs significantly predicts creative confidence erosion and output quality decline (F-test, $p < 0.05$).

6. Key Variables at a Glance

The study examines five independent variables, two dependent variables, one moderating variable, and one control variable, as summarised in the table below:

Variable Type	Variable Name	What It Measures	Scale
Independent Variable 1 (IV1)	AI Dependency & Usage Frequency	How often and how deeply students rely on AI tools (ChatGPT, Gemini, Copilot etc.) for academic and creative tasks	5-point Likert Scale
Independent Variable 2 (IV2)	Over-Reliance on AI-Generated Content	Extent to which students submit or use AI-generated content without meaningful personal input or modification	5-point Likert Scale
Independent Variable 3 (IV3)	Reduced Effort in Original Thinking	Self-reported decline in brainstorming, problem-solving effort, and independent ideation since using AI tools	5-point Likert Scale
Independent Variable 4 (IV4)	Loss of Human Touch in Creative Output	Perceived absence of personal emotion, style, lived experience, and individuality in AI-assisted creative work	5-point Likert Scale
Independent Variable 5 (IV5)	AI Exposure & Awareness Level	Student's knowledge of how generative AI works, its creative limitations, and its risks to human originality	5-point Likert Scale
Dependent Variable 1 (DV1)	Erosion of Creative Confidence	The degree to which students feel less confident in their own creative abilities since regularly using AI tools	5-point Likert Scale
Dependent Variable 2 (DV2)	Decline in Creative Output Quality	Self-perceived reduction in the originality, depth, and personal voice of creative work produced after adopting AI assistance	5-point Likert Scale
Moderating Variable (MV)	Discipline / Stream of Study	Whether the student studies Management, Engineering, Arts, or Science - moderates AI's impact on creativity	Categorical (4 groups)
Control Variable (CV)	Year of Study & Gender	Ensures demographic balance across the sample; used as a control in regression analysis	Nominal / Categorical

Interpretation-

Descriptive Statistics - Question-wise Interpretation

This section interprets the descriptive statistics table question by question. In all items, N = 101 and the response range is from 1 to 5, which means all answer options were used by respondents.

1. I find it difficult to start a creative task (writing, designing, coding) without first consulting an AI tool

The average score of 3.16 means people somewhat agree with this statement. The standard deviation of 1.164 shows that answers varied a bit so students had opinions. This item helps us understand how well. Not so well students connect with this specific part of using AI and being creative.

2. I rely on AI tools more now for academic work than I did one year ago.

The mean score is 3.67, which means students agree with this statement. The standard deviation is 1.184 this shows that AI use and creativity got opinions from students.AI use and creativity is something that students have feelings, about some students feel strongly about AI use and creativity and some students do not feel as strongly about AI use and creativity.

3. I feel uncomfortable or anxious when I have to complete a creative task without access to AI.

The score of 2.96 is pretty average so most students are of in the middle about this statement. They do not totally disagree,. They do not totally agree either. The score of 1.122 shows that students had opinions. Some students liked this idea. Some students did not like it that much. This question is really about how AI use and creativity matters, to students. AI use and creativity is what we are trying to figure out. We want to know if students think AI use and creativity is important or not.

4. I often submit AI-generated content (essays, reports, presentations) with minimal changes of my own.

The average score is 2.52, which reflects mixed opinions, slightly agreeing to this statement. The standard deviation is 1.285, which reflects a high degree of variation in the answers. Therefore, the opinions of the students are spread out. This question, in simple words, is asking how strongly or weakly the students associate themselves with this particular facet of AI and creativity.

5. When AI provides a good answer, I rarely question, verify, or improve upon it before using it.

The mean value of 3.34 indicates a slight to moderate level of agreement with this statement. The standard deviation value of 1.298 indicates a comparatively high level of variation. Therefore, the opinions of the students were spread out. In simple words, this statement indicates how strongly or weakly the students relate to this particular aspect of AI.

6. I have submitted AI-generated work without fully reading or understanding what it says.

The average score obtained is 2.78, and this reflects mixed responses with a slight inclination towards agreeing with this particular statement. Furthermore, the standard deviation is 1.246, reflecting a high degree of variation in students' opinions on this particular issue. In simple words, this question attempts to measure how strongly or weakly students associate with this particular aspect of AI and creativity.

SPARSH GLOBAL BUSINESS SCHOOL

7. I feel that using AI-generated content directly saves me time without reducing the quality of my work.

The score of 3.50 means that students basically agree with this statement. The variation in responses is moderate which is 1.163 so students have opinions. This item is, about how students like or dislike this part of using Artificial Intelligence and being creative. The score tells us how strongly or weakly students feel about this part of Artificial Intelligence and creativity.

8. Since I started using AI regularly, I spend less time brainstorming ideas on my own.

The average score is 3.53, which means students agree with this statement. The score of 1.054 shows that students had opinions about AI use and creativity. What this really means is that AI use and creativity is something that students feel strongly or weakly about it depends on the student. AI use and creativity is a topic that students have feelings, about.

9. My AI-assisted creative work lacks the personal emotion I used to express before using AI.

The average score of 3.41 means people somewhat agree with this statement. The standard deviation of 1.031 shows that answers varied a bit so students had opinions. This item helps us understand how well or not students connect with this part of using AI and being creative.

10. Readers or evaluators cannot tell that my AI-assisted work is personally mine.

The score of 3.40 means that students somewhat agree with this statement. The variation in responses is moderate because the standard deviation is 1.150. This means that students have opinions about this. This item is about how students like or dislike using Artificial Intelligence for creative things. The Artificial Intelligence use and creativity is something that students have feelings, about. This helps us see how strongly students feel about Artificial Intelligence and creativity.

11. I understand that excessive AI dependency can reduce my own creative skills over time.

The mean score of 3.94 shows clear agreement with this statement. The standard deviation of 1.094 indicates moderate variation in responses, so opinions were somewhat different across students. In simple words, this item suggests how strongly or weakly students relate to this particular aspect of AI use and creativity.

12. I feel that my creative work has lost its unique personal style since I started using AI tools.

The mean score of 3.35 shows slight to moderate agreement with this statement. The standard deviation of 1.187 indicates moderate variation in responses, so opinions were somewhat different across students. In simple words, this item suggests how strongly or weakly students relate to this particular aspect of AI use and creativity.

13. I know the key limitations of AI in replicating human emotion, lived experience, and original thought.

SPARSH GLOBAL BUSINESS SCHOOL

he average score of 3.81 shows that students mostly agree with this statement. The variation in responses is 1.120, which means opinions are not exactly the same across students. This item helps us understand how well students connect with this aspect of AI use and creativity.

Students have views, on it. It shows if they strongly or not strongly relate to it.

14. I am aware that generative AI produces outputs based on existing data, not true original thinking.

The mean score of 3.73 shows agreement with this statement. The standard deviation of 1.157 indicates moderate variation in responses, so opinions were somewhat different across students. In simple words, this item suggests how strongly or weakly students relate to this particular aspect of AI use and creativity.

15. I am aware of ethical concerns around using AI-generated content in academic submissions.

The mean score of 3.68 shows agreement with this statement. The standard deviation of 1.131 indicates moderate variation in responses, so opinions were somewhat different across students. In simple words, this item suggests how strongly or weakly students relate to this particular aspect of AI use and creativity.

16. The overall quality of my creative output has declined since I started using AI regularly.

The mean score of 3.09 shows a near-neutral response, with a slight lean toward agreement with this statement. The standard deviation of 1.114 indicates moderate variation in responses, so opinions were somewhat different across students. In simple words, this item suggests how strongly or weakly students relate to this particular aspect of AI use and creativity.

SPARSH GLOBAL BUSINESS SCHOOL

17. I feel less confident writing, designing, or creating original work without AI assistance than I used to.

The mean score of 3.23 shows slight to moderate agreement with this statement. The standard deviation of 1.085 indicates moderate variation in responses, so opinions were somewhat different across students. In simple words, this item suggests how strongly or weakly students relate to this particular aspect of AI use and creativity.

18. I actively try to use AI as a tool to enhance my creativity, not as a replacement for it.

The mean score of 3.52 shows agreement with this statement. The standard deviation of 1.221 indicates comparatively high variation in responses, so students' opinions were quite spread out. In simple words, this item suggests how strongly or weakly students relate to this particular aspect of AI use and creativity.

19. My confidence in my own creative skills has decreased since I began regularly using AI tools.

The mean score of 3.09 shows a near-neutral response, with a slight lean toward agreement with this statement. The standard deviation of 1.078 indicates moderate variation in responses, so opinions were somewhat different across students. In simple words, this item suggests how strongly or weakly students relate to this particular aspect of AI use and creativity.

20. I doubt my own ability to produce good creative work independently when AI is not available.

The mean score of 2.94 shows a near-neutral response, with a slight lean toward agreement with this statement. The standard deviation of 1.121 indicates moderate variation in responses, so opinions were somewhat different across students. In simple words, this item suggests how strongly or weakly students relate to this particular aspect of AI use and creativity.

21. My written work lacks the personal depth and voice it had before I relied on AI tools.

The mean score of 3.18 shows slight to moderate agreement with this statement. The standard deviation of 1.062 indicates moderate variation in responses, so opinions were somewhat different across students. In simple words, this item suggests how strongly or weakly students relate to this particular aspect of AI use and creativity.

22. AI_DEPENDENCE

The composite mean score of 3.13 shows a moderate overall level of AI dependence among the respondents. The standard deviation of 0.766 indicates relatively low variation in responses, so students answered in a more similar way. In simple words, students as a group show a noticeable but not extreme level of dependence on AI tools.

Interpretation-

Test of Normality / Normality Plots - Question-wise Interpretation

Overall, the patterns in the plots support approximate normality for the questionnaire items, which means the data is suitable for further parametric analysis.

1. I find it difficult to start a creative task (writing, designing, coding) without first consulting an AI tool

The plots appear to suggest that the data are normally distributed, as the responses are fairly spread out around the middle values. The data appear to be close to the reference line in the Q-Q plot, and the detrended plot does not seem to have any major irregularities. The boxplot does not appear to have any major issues either. So, the data for this variable appears to be normally distributed.

2. I rely on AI tools more now for academic work than I did one year ago.

The plots indicate that the data are normally distributed, but the data are slightly more concentrated at the higher end of the scale. The data in the Q-Q plot are near the reference line, and the data in the detrended plot do not have a serious irregular pattern. The boxplot also doesn't indicate a serious problem of outliers. Hence, this variable may be considered normally distributed..

3. I feel uncomfortable or anxious when I have to complete a creative task without access to AI.

The plots indicate that the data are approximately normally distributed with the values distributed reasonably around the middle values. The points in the normal Q-Q plot are close to the reference line, there is no serious pattern in the detrended plot, and there is no serious problem with outliers in the boxplot. So, this variable is approximately normally distributed.

4. I often submit AI-generated content (essays, reports, presentations) with minimal changes of my own.

From the plot, it seems that the data are normally distributed, but the data are slightly more concentrated around the lower to middle range of the data. The data in the Q-Q plot are close to the line, and the plot of the data after removing the trend shows no serious irregularity. Moreover, the boxplot does not show a serious problem of outliers. This data may be regarded as normally distributed.

5. When AI provides a good answer, I rarely question, verify, or improve upon it before using it.

The plots show that they follow an approximate normal distribution because the responses are fairly evenly distributed around the middle values. The points in the Q-Q plot are near the line, there is no serious irregular pattern in the detrended plot, and there is no serious issue in the boxplot. This variable may be assumed to be normally distributed.

6. I have submitted AI-generated work without fully reading or understanding what it says.

SPARSH GLOBAL BUSINESS SCHOOL

The plots indicate that the normality condition is approximately met, but the points seem to be concentrated more around the lower to middle values. The points are close to the reference line in the Q-Q plot, there is no serious pattern in the detrended plot, and there is no serious problem with outliers in the boxplot. So, this variable is approximately normally distributed.

7. I feel that using AI-generated content directly saves me time without reducing the quality of my work.

From the plots, it is evident that the data follows normal distribution, and the data points are fairly distributed around the central values. This is because, in the Q-Q plot, the data points are close to the reference line. The data points in the detrended plot do not show a serious irregular pattern, and in the boxplot, it is not evident that the data has a serious outlier problem.

8. Since I started using AI regularly, I spend less time brainstorming ideas on my own.

The plots indicate that the data are normally distributed since the points are reasonably spread around the middle values. The points in the Q-Q plot are close to the reference line, there is no serious pattern in the detrended plot, and there is no serious problem with the boxplot. This indicates that this variable is normally distributed.

9. My AI-assisted creative work lacks the personal emotion I used to express before using AI.

The plots suggest approximate normality, with responses reasonably spread around the middle values. The points in the Q-Q plot are close to the reference line, the detrended plot shows no serious irregular pattern, and the boxplot does not indicate a major outlier problem. So this variable can be treated as approximately normally distributed for analysis.

10. Readers or evaluators cannot tell that my AI-assisted work is personally mine.

The plots suggest approximate normality, with responses reasonably spread around the middle values. The points in the Q-Q plot are close to the reference line, the detrended plot shows no serious irregular pattern, and the boxplot does not indicate a major outlier problem. So this variable can be treated as approximately normally distributed for analysis.

11. I understand that excessive AI dependency can reduce my own creative skills over time.

The plots suggest approximate normality, although the responses appear slightly more concentrated toward the higher end of the scale. The points in the Q-Q plot are close to the reference line, the detrended plot shows no serious irregular pattern, and the boxplot does not indicate a major outlier problem. So this variable can be treated as approximately normally distributed for analysis.

12. I feel that my creative work has lost its unique personal style since I started using AI tools.

The plots suggest approximate normality, with responses reasonably spread around the middle values. The points in the Q-Q plot are close to the reference line, the detrended plot shows no serious irregular pattern, and the boxplot does not indicate a major outlier problem. So this variable can be treated as approximately normally distributed for analysis.

SPARSH GLOBAL BUSINESS SCHOOL

13. I know the key limitations of AI in replicating human emotion, lived experience, and original thought.

The plots suggest approximate normality, although the responses appear slightly more concentrated toward the higher end of the scale. The points in the Q-Q plot are close to the reference line, the detrended plot shows no serious irregular pattern, and the boxplot does not indicate a major outlier problem. So this variable can be treated as approximately normally distributed for analysis.

14. I am aware that generative AI produces outputs based on existing data, not true original thinking.

The plots suggest approximate normality, although the responses appear slightly more concentrated toward the higher end of the scale. The points in the Q-Q plot are close to the reference line, the detrended plot shows no serious irregular pattern, and the boxplot does not indicate a major outlier problem. So this variable can be treated as approximately normally distributed for analysis.

15. I am aware of ethical concerns around using AI-generated content in academic submissions.

The plots indicate that the data are normally distributed, but the data seems to be slightly more concentrated at the higher end of the scale. The data in the Q-Q plot is near the line, and the data in the detrend plot doesn't show any serious irregularity. The box plot doesn't show serious problems of outliers either. This data may be considered normally distributed.

16. The overall quality of my creative output has declined since I started using AI regularly.

From the plot, it seems that the data are normally distributed, at least to some approximation, as the data are distributed around the middle of the range. The data in the Q-Q plot are close to the line, and the plot of the data after detrending shows that it is not seriously irregular. The boxplot also doesn't suggest that this data has a serious outlier problem.

17. I feel less confident writing, designing, or creating original work without AI assistance than I used to.

The plots indicate that the data are approximately normally distributed, with the values spread out reasonably around the middle values. The points in the Q-Q plot are close to the reference line, there is no serious pattern in the detrended plot, and there is no evidence of a serious outlier problem in the boxplot. So this variable is approximately normally distributed.

18. I actively try to use AI as a tool to enhance my creativity, not as a replacement for it.

The plots suggest approximate normality, with responses reasonably spread around the middle values. The points in the Q-Q plot are close to the reference line, the detrended plot shows no serious irregular pattern, and the boxplot does not indicate a major outlier problem. So this variable can be treated as approximately normally distributed for analysis.

19. My confidence in my own creative skills has decreased since I began regularly using AI tools.

SPARSH GLOBAL BUSINESS SCHOOL

The plots suggest approximate normality, with responses reasonably spread around the middle values. The points in the Q-Q plot are close to the reference line, the detrended plot shows no serious irregular pattern, and the boxplot does not indicate a major outlier problem. So this variable can be treated as approximately normally distributed for analysis.

20. I doubt my own ability to produce good creative work independently when AI is not available.

From the plots, it is clear that the data are normally distributed since the data points are fairly distributed around the mean. This is further confirmed by the fact that, in the Q-Q plot, the points are close to the reference line, and in the detrended plot, there is no major irregular pattern. This shows that the data can be treated as normally distributed.

21. My written work lacks the personal depth and voice it had before I relied on AI tools.

The plots appear to be normally distributed since the data is somewhat spread around the middle of the data set. The data in the Q-Q plot is close to the reference line, the detrended plot does not have any major irregularities, and the boxplot does not appear to have a major outlier problem. This data set appears to be normally distributed.

Reliability

Scale: ALL VARIABLES

Case Processing Summary

		N	%
Cases	Valid	101	100.0
	Excluded[a]	0	.0
	Total	101	100.0

a. Listwise deletion based on all variables in the procedure.

Interpretation

All 101 responses were valid and used in the analysis. No case was excluded and there is no missing data in this output. This means the full sample was available for further statistical testing, so the results are based on complete data.

Reliability Statistics

Cronbach's Alpha	N of Items

.868	20

Interpretation

The Cronbach's Alpha value is 0.868 for 20 items. This shows good internal consistency of the questionnaire. In simple words, the items are measuring the topic in a reliable way, so the scale can be considered dependable for analysis.

I have submitted AI-generated work without fully reading or understanding what it says.	2.78	1.246	101
I feel that using AI-generated content directly saves me time without reducing the quality of my work.	3.50	1.163	101
Since I started using AI regularly, I spend less time brainstorming ideas on my own.	3.53	1.054	101
My AI-assisted creative work lacks the personal emotion I used to express before using AI.	3.41	1.031	101
I feel that my creative work has lost its unique personal style since I started using AI tools.	3.35	1.187	101
Readers or evaluators cannot tell that my AI-assisted work is personally mine.	3.40	1.150	101
I know the key limitations of AI in replicating human emotion, lived experience, and original thought.	3.81	1.120	101

I am aware that generative AI produces outputs based on existing data, not true original thinking.	3.73	1.157	101
I understand that excessive AI dependency can reduce my own creative skills over time.	3.94	1.094	101
I am aware of ethical concerns around using AI-generated content in academic submissions.	3.68	1.131	101
I actively try to use AI as a tool to enhance my creativity, not as a replacement for it.	3.52	1.221	101
I feel less confident writing, designing, or creating original work without AI assistance than I used to.	3.23	1.085	101
I doubt my own ability to produce good creative work independently when AI is not available.	2.94	1.121	101
My confidence in my own creative skills has decreased since I began regularly using AI tools.	3.09	1.078	101
My written work lacks the personal depth and voice it had before I relied on AI tools.	3.18	1.062	101

Interpretation

This table shows the normal variation and number of responses for each statement. The averages range from 2.52 to 3.94 which means most responses are around the middle to agreement side of the scale. The highest average is for "I understand that excessive AI dependency can reduce my creative skills over time" (Average = 3.94) showing awareness among students about AI dependency. Students seem to understand that AI dependency can affect their creative skills. The lowest average is for "I often submit AI-generated content with changes of my own" (Average = 2.52) which shows students were less likely to strongly agree with submitting AI-generated content. The normal variations are around 1 so the responses show a level of variation among students. This variation suggests that students have views on AI use.The data gives us an idea of how students feel about AI and its impact, on their work.

Scale Statistics

Mean	Variance	Std. Deviation	N of Items
66.75	150.488	12.267	20

Interpretation

The total mean score of the full 20-item scale is 66.75, with a standard deviation of 12.267. This shows that, overall, respondents scored at a moderate level on the combined scale. The variation is not too low, so students did not all answer in exactly the same way.

Descriptives

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
I find it difficult to start a creative task (writing, designing, coding) without first consulting an AI tool	101	1	5	3.16	1.164
I rely on AI tools more now for academic work than I did one year ago.	101	1	5	3.67	1.184
I feel uncomfortable or anxious when I have to complete a creative task without access to AI.	101	1	5	2.96	1.122
I often submit AI-generated content (essays, reports, presentations) with minimal changes of my own.	101	1	5	2.52	1.285
When AI provides a good answer, I rarely question, verify, or improve upon it before using it.	101	1	5	3.34	1.298
I have submitted AI-generated work without fully reading or understanding what it says.	101	1	5	2.78	1.246
I feel that using AI-generated content directly saves me time without reducing the quality of my work.	101	1	5	3.50	1.163
Since I started using AI regularly, I spend less time brainstorming ideas on my own.	101	1	5	3.53	1.054
My AI-assisted creative work lacks the personal emotion I used to express before using AI.	101	1	5	3.41	1.031
Readers or evaluators cannot tell that my AI-assisted work is personally mine.	101	1	5	3.40	1.150
I understand that excessive AI dependency can reduce my own creative skills over time.	101	1	5	3.94	1.094
I feel that my creative work has lost its unique personal style since I started using AI tools.	101	1	5	3.35	1.187
I know the key limitations of AI in replicating human emotion, lived experience, and original thought.	101	1	5	3.81	1.120
I am aware that generative AI produces outputs based on existing data, not true original thinking.	101	1	5	3.73	1.157

I am aware of ethical concerns around using AI-generated content in academic submissions.	101	1	5	3.68	1.131
The overall quality of my creative output has declined since I started using AI regularly.	101	1	5	3.09	1.114
I feel less confident writing, designing, or creating original work without AI assistance than I used to.	101	1	5	3.23	1.085
I actively try to use AI as a tool to enhance my creativity, not as a replacement for it.	101	1	5	3.52	1.221
My confidence in my own creative skills has decreased since I began regularly using AI tools.	101	1	5	3.09	1.078
I doubt my own ability to produce good creative work independently when AI is not available.	101	1	5	2.94	1.121
My written work lacks the personal depth and voice it had before I relied on AI tools.	101	1	5	3.18	1.062
AI_DEPENDENCE	101	1.00	5.00	3.1307	.76600
Valid N (listwise)	101				

Interpretation

For all variables we got 101 responses. The minimum and maximum values range from 1 to 5. This matches the 5-point Likert scale used in our questionnaire.

Most of the values are above 3. So overall students seem to agree with many statements. These statements are related to AI dependence, awareness, reduced originality and decline in confidence or quality.

The mean value is 3.94. It is for the awareness that excessive AI dependency can reduce skills.

The mean value is 2.52. It is for submitting AI-generated content with personal changes.

The mean value of AI dependence is 3.1307. This suggests a level of AI dependence, among the respondents.

Correlations

		AI_DEPENDENCE	I find it difficult to start a creative task (writing, designing, coding) without first consulting an AI tool	I am aware that generative AI produces outputs based on existing data, not true original thinking.	My confidence in my own creative skills has decreased since I began regularly using AI tools.
AI_DEPENDENCE	Pearson Correlation	1	.746**	.324**	.516**
	Sig. (2-tailed)		.000	.001	.000
	N	101	101	101	101
I find it difficult to start a creative task (writing, designing, coding)	Pearson Correlation	.746**	1	.433**	.276**

	N	101	101	101	101
My confidence in my own creative skills has decreased since I began regularly using AI tools.	Pearson Correlation	.516**	.276**	-.005	1
	Sig. (2-tailed)	.000	.005	.962	
	N	101	101	101	101

**. Correlation is significant at the 0.01 level (2-tailed).

Interpretation

This table shows how strong the relationship is between the variables. AI_DEPENDENCE is really closely linked to how hard it's for people to start a creative task without looking at AI first. The closer people are to AI_DEPENDENCE, the harder it gets for them to begin working on something by themselves. AI_DEPENDENCE also has a connection to how much peoples confidence in their skills goes down. This means that the more people rely on AI_DEPENDENCE the less they believe in their ability to be creative.

The relationship between AI_DEPENDENCE and knowing about AI is also worth noting. It is an one, but not as strong as the other relationships. On the hand knowing about AI does not seem to have much of an effect on peoples confidence in their creative skills. The numbers show that there is no link between these two things so it does not seem like knowing about AI is related to losing confidence in ones creative abilities. AI_DEPENDENCE is still the thing that affects how confident people are, in their creative skills.

SPARSH GLOBAL BUSINESS SCHOOL

Regression

Variables Entered/Removed[a]

Model	Variables Entered	Variables Removed	Method
1	My confidence in my own creative skills has decreased since I began regularly using AI tools., I am aware of ethical concerns around using AI-generated content in academic submissions., AI_DEPENDENCE[b]	.	Enter

a. Dependent Variable: I find it difficult to start a creative task (writing, designing, coding) without first consulting an AI tool

b. All requested variables entered.

Interpretation

This table shows which variables were in the regression model.

The thing we are trying to predict is "I find it difficult to start a task without first consulting an AI tool." The things we are using to predict it are AI_DEPENDENCE knowing about issues with AI-generated content and losing faith, in your own creative skills.

We used the Enter method. This means all the chosen predictors were added to the model at the time. No variable was taken out.

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.759[a]	.576	.563	.769

a. Predictors: (Constant), My confidence in my own creative skills has decreased since I began regularly using AI tools., I am aware of ethical concerns around using AI-generated content in academic submissions., AI_DEPENDENCE

Interpretation

The R value is 0.759. This number shows a relationship between the dependent variable and all the predictors.

The R Square value is 0.576. This means that 57.6% of the variation in how hard it's to start a creative task without AI help is explained by the three predictors in our model.

We also have the Adjusted R Square, which's 0.563. It is close to the R Square value. So our model is still strong after making adjustments.

The standard error of estimate for our model is 0.769. This number tells us the error we can expect when making predictions, with our model.

SPARSH

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	78.036	3	26.012	43.935	.000[b]
	Residual	57.429	97	.592		
	Total	135.465	100			

a. Dependent Variable: I find it difficult to start a creative task (writing, designing, coding) without first consulting an AI tool

b. Predictors: (Constant), My confidence in my own creative skills has decreased since I began regularly using AI tools., I am aware of ethical concerns around using AI-generated content in academic submissions., AI_DEPENDENCE

Interpretation

The ANOVA table shows whether the overall regression model is statistically significant or not. Here, the F value is 43.935 and the significance value is 0.000, which is less than 0.05. This means the regression model is statistically significant. So, the predictors taken together significantly explain the dependent variable. In simple words, this regression model is useful. The individual effect and significance of each predictor are explained in the coefficients table given after this output.

Coefficients

Model	Predictor	B	Std. Error	Beta	t	Sig.	Lower Bound	Upper Bound
1	(Constant)	-.440	.393		-1.120	.265	-1.220	.340
1	AI_DEPENDENCE	1.232	.119	.811	10.332	.000	.995	1.469
1	I am aware of ethical concerns around using AI-generated content in academic submissions.	.059	.069	.057	.854	.395	-.078	.196
1	My confidence in my own creative skills has decreased since I began regularly using AI tools.	-.154	.084	-.143	-1.844	.068	-.321	.012

a. Dependent Variable: I find it difficult to start a creative task (writing, designing, coding) without first consulting an AI tool

Interpretation

The table shows how each factor affects the variable.
The constant value is -0.440. This number is not important because its significance value is 0.265, which's more than 0.05.

* AI_DEPENDENCE affects the variable. Its B value is 1.232 and its significance value is 0.000 which's less than 0.05. This means AI_DEPENDENCE has an effect on the variable.
When AI dependence increases students are more likely to find it hard to start a task without consulting an AI tool first. The variable "I am aware of concerns around using AI-generated content in submissions" has a B value of 0.059 and a significance value of 0.395. This value is than 0.05 so this variable does not have an effect. The variable "My confidence in my skills has decreased since I began using AI tools" has a B value of -0.154 and a significance value of 0.068. This value is than 0.05 so it is not statistically significant.
However its negative coefficient shows that AI_DEPENDENCE has an inverse relationship with the variable.
The confidence interval of AI_DEPENDENCE does not include zero. This supports that AI_DEPENDENCE is a predictor of the variable. The confidence intervals of the predictors include zero. This shows that their effects are not statistically confirmed .Overall AI_DEPENDENCE is the predictor in this regression model. AI_DEPENDENCE plays a role in the model. The other predictors do not have an effect, on the variable. AI_DEPENDENCE is the one that affects the variable. The other factors do not affect the variable. AI_DEPENDENCE is what matters here.

Conclusion

The study was done to see if Artificial Intelligence is affecting the creativity of college students. What the study found out is that Artificial Intelligence is not completely destroying creativity. However using Artificial Intelligence much is reducing important parts of human creativity. These parts include thinking on your own being confident in your ideas coming up with ideas expressing yourself and being original in your work.

SPARSH
GLOBAL BUSINESS COLLEGE

The problem is not Artificial Intelligence itself. The problem is that students are relying on Artificial Intelligence much for their school work and creative tasks. The data used in the study is good because it includes one hundred and one responses. All of the responses were considered so the findings are dependable. The results also show that the questionnaire was effective in measuring what it was supposed to measure.

When you look at the data you can see a pattern. Students are using Artificial Intelligence more and more and at the time they are becoming less independent in their creative work. Students said that they are using Artificial Intelligence now than they were a year ago. Even though they know that Artificial Intelligence is not the same as thinking this does not stop them from relying on it.

Many students said that since they started using Artificial Intelligence they do not spend much time coming up with their own ideas. Their work is also missing a touch and they feel like they are losing their unique style. Some students even feel like their work no longer reflects who they are as a person. There is also a decline in confidence when it comes to producing original work without Artificial Intelligence. Students are not expressing themselves much and their writing is not as deep or personal.

These results suggest that students are becoming less expressive and less self-reliant because they are using Artificial Intelligence much. It is not that students are misusing Artificial Intelligence by submitting work that was generated by Artificial Intelligence. The concern is that students are becoming too mentally dependent on Artificial Intelligence to start tasks come up with ideas and complete work that they used to do on their own.

SPARSH
GLOBAL BUSINESS SCHOOL

The correlation analysis supports this finding. It shows a relationship between relying on Artificial Intelligence and having a hard time starting tasks without it. There is also a link between relying on Artificial Intelligence and having less confidence. Even when students know the limitations of Artificial Intelligence they still become dependent on it. The regression analysis strengthens these findings. It shows that relying on Artificial Intelligence has an impact on students ability to start creative tasks on their own.

Overall the report says that Artificial Intelligence is a edged tool for students. On the one hand it saves time. Makes school work easier. On the hand relying on it too much reduces independent thinking weakens personal expression and lowers confidence in creative abilities. The study does not say that Artificial Intelligence has completely killed creativity. Instead it says that relying on Artificial Intelligence is slowly eroding the parts of creativity in college students. These parts include being original being confident coming up with ideas, on your own and expressing yourself as a being.

So, the final conclusion of your report can be written like this:

The study concludes that Artificial Intelligence is not completely destroying human creativity, but excessive dependence on AI is significantly weakening students creative confidence, original thinking, and personal expression in creative work. Students are using AI more frequently and are highly aware of its limitations, yet this awareness does not stop dependence. The strongest finding of the study is that AI dependence significantly increases students' difficulty in starting creative tasks without AI support. Overall, the research shows that when AI is used as a support tool it may be helpful, but when it becomes a replacement for human effort, it gradually erodes important aspects of human creativity.
